

LL Navigator™ is a browser-based tool to boost user performance for OpenText Content Server or OpenText Livelink®. The tool mimics Windows Explorer and allows users to execute 80 % of their regular tasks in a highly efficient way. Users can create new items such as documents, folders, E-mail folders and compound documents using standard Livelink / Content Server forms. LL Navigator allows users to toggle back and forth to the standard view to perform less frequent tasks such as view an item's audit details. The figure below shows LL Navigator during the uploading of a folder containing multiple documents.

LL Navigator allows users to upload multiple documents using drag and drop. Chrome and Opera also support drag and drop of folder structures. Drag and drop can also be used to move or copy items within Content Server. LL Navigator automatically extracts email metadata from Outlook msg files. It is also possible to download multiple documents to the desktop or download multiple levels into a zip file.

LL Navigator has been built with performance as a key characteristic. Typical operations like browsing a folder result in 60 % less network traffic than the standard Content Server browser interface. Caching provides users with a highly responsive user interface to minimize waiting times. LL Navigator uses multiple parallel processes. Service degradation can be avoided by throttling the number of parallel processes and the maximum file size.

Organisations can reduce the complexity of their IT landscape and/or operational costs by replacing Enterprise Connect / WebDAV by deploying LL Navigator. LL Navigator also enables extranet users to work more efficiently and addresses performance issues for users connecting to Content Server under constrained network conditions. "Download & Zip" allows users to download content in a highly efficient way.

Deployment of LL Navigator is very easy since it consists of a single HTML file (240 kB) and does not require any software installation on the server or user's computer. LL Navigator uses HTML5 and the current version supports Chrome, Opera, FireFox and Internet Explorer 10 and 11. LL Navigator supports Livelink 9.7.0, Livelink 9.7.1, Content Server 10.0 and Content Server 10.5.

LL Navigator features

Intuitive user interface

Windows Explorer like interface for Content Server in a browser.

Core functionalities

Allows creating of documents, compound documents, E-mail folders and folders. Support for categories and versioning.

Extended functionalities

Upload files or complete folder structures using drag and drop. Copy or Move content using drag and drop. Automatic extraction of email metadata from Outlook msg files. Download & Zip folders.

Performance

Supports parallel processes, caching and reduces network load by 50 – 90 % for common operations. Efficient access to nested content via Favourites.

Deployment

Very easy to deploy since it requires no software installation.

Security

Uses Content Server permissions and supports all authentication mechanisms.

Licensing

Flexible licensing model to meet your needs.
