

Membership is a browser-based solution to list all SharePoint / Teams sites a user has access to.

Key features

Functionality

List all SharePoint / Teams sites a user has access to.

Performance

Excellent performance by making optimum use of search and using parallel processes.

Deployment

SPFx app (web part) for SharePoint Online / Teams. Single aspx file for on-premise SharePoint.

Supported Systems

SharePoint Online, Microsoft Teams, SharePoint 2016 / 2019.

Browsers: Edge, Chrome, Firefox, Opera and Safari.

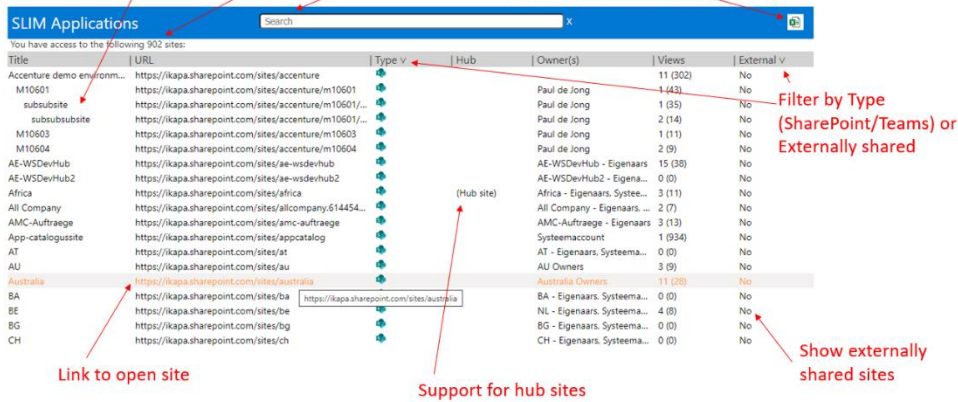

Licensing

Licensed per tenant.

The Membership app uses search to show a security trimmed list with sites and subsites. Private Teams channels are shown with a padlock. Hovering over a (sub)site exposes the link and allows the user to navigate to that site.

The list shows the main characteristics of each site such as Teams connected, related hub sites, owner(s), views and external sharing settings. The app provides search and filtering capabilities and the list with sites can be exported as a CSV file. The header bar and the title are customizable. The list is security trimmed so it will not contain sites the user does not have access to.

The on-premise version offers several advanced features:

Use search and/or REST API

The tool can use search and/or REST API to generate a consolidated list. The results are combined to provide a complete and consolidated list.

Filter permissions level

The Membership tool can be configured to automatically check the permissions of the sites to ensure a fully accurate list is shown.

Excluded domain / sites / paths

The tool can be configured to exclude domains, sites or paths such as /portals.

Support for AAM

Alternate Access Mappings can be automatically replaced by the primary SharePoint URL (optional).

Performance

Parallel requests and batch requests are used to deliver a performant solution that allows users to navigate to their sites of interest.
